How Lipodissolve can work for you

Lipodissolve is a medical treatment that actually dissolves fat in your face and body without surgery.

How does it work?

Step 1: A series of small specialized injections are placed in your desired treatment areas.

Step 2: The injections stimulate an inflammatory reaction causing fat cells to dissolve.

Step 3: Your body then eliminates the fat over the next few weeks and the overlaying skin tightens.

Lipodissolve is not liposuction and it is not surgery. It is a medical treatment designed to remove fat, tighten skin, and contour those difficult areas.
